Influence of heating temperature and holding time on biochars derived from rubber wood sawdust via slow pyrolysis

A. Shafarian*, San-Meng Sa* 1, As Fizah Curley, Jarrah M. Jom, Mohamed Hazlina Mohd. Kamar, Mary M. Mizan

> Highlights
- Biochars were derived from rubber wood sawdust via slow pyrolysis.
- Heating temperatures (HT) ranged from 300 to 700 °C and heating time (HT) ranged from 1 to 3 h.
- They were characterised by XRD, FT-IR, elemental analysis, N2, GC and SEM-EDX.
- At low HT and RT, biochar consists of more acidic groups with lower pH.
- At high HT and RT, biochar obtained larger surface area and total pore volume.
