NONLINEAR ENERGY HARVESTING DEVICE FOR LOW FREQUENCY HUMAN MOTION APPLICATION

KHALIS BIN SUHAIMI

A thesis submitted in fulfillment of the requirements for the degree of Master of Science in Mechanical Engineering

Faculty of Mechanical Engineering

UNIVERSITI TEKNIKAL MALAYSIA MELAKA

2015
DECLARATION

I declare that this thesis entitled “Nonlinear Energy Harvesting Device for Low Frequency Human Motion Application” is the result of my own research except as cited in the references. The thesis has not been accepted for any degree and is not concurrently submitted in candidature of any other degree.

Signature : ........................................
Name : KHALIS BIN SUHAMIM
Date : ........................................
APPROVAL

I hereby declare that I have read this thesis and in my opinion this thesis is sufficient in terms of scope and quality for the award of Master of Science in Mechanical Engineering.

Signature : .................................................
Supervisor Name : Dr. ROSZAIDI RAMLAN
Date : .......................................................
DEDICATION

To my beloved family and colleagues.
ABSTRACT

Energy harvesting from ambient sources had received much attention in the past few years due to worldwide awareness on green technology expands. In vibration based energy harvesting, resonant linear generator are commonly used as the harvesting devices. However, a linear generator induces several limitations. The power harvested by a linear generator is proportional to the cube of excitation frequency and the power is maximum in a narrow bandwidth only. In this research, human motion vibration was selected as an input excitation and its frequency content is investigated. The frequency of human motion was investigated by placing a vibration recorder on a test subject under 5km/h walking and 9 km/h jogging speed. The investigation shows that the human motion vibration is distributed in the low frequency region. Hence, a device that can operate optimally with low frequency input and has the ability to overcome the narrow bandwidth limitation is designed. A device is designed to overcome the limitations of the linear generators. This device has the combination of the tuning, frequency-up conversion, multimodal and non-linear techniques. The aim is to amplify the input frequency to a higher frequency and at the same time, widen the bandwidth of response. The frequency-up mechanism is made by transforming the translation motion into the rotary motion by using gear ratio to amplify the response to a higher rotational speed. Winding springs are used with twistable enclosure cap to alter the device stiffness. The angles of twist of the enclosure cap are ranging from 180 degree to 900 degree. Two oscillating masses are connected to the device. Each mass can be set with different characteristic to widen the bandwidth. The two masses are also configured with non-linear softening and non-linear hardening properties to further widen the bandwidth. The non-linearities of the system are changed by varying the magnets gap. The non-linear restoring force of the system shows the influences of the linear coefficient and non-linear coefficient. The device is then investigated with two sets of experiments. The quasi-static measurement is to investigate the system stiffness and dynamic measurement is to investigate its response across a frequency range. In the dynamic measurement the device is excited with sinusoidal inputs and real human motion inputs. Overall, the results obtained from the experiment show that device is able to produce frequency amplification. The response also shows that with a properly tuned system, both softening and hardening can produce a flat response which is insensitive to excitation frequency as well as at amplified amplitude.
ABSTRAK

ACKNOWLEDGEMENTS

I would like to express my sincere gratitude to my supervisors, Dr. Roszaidi Ramlan and Dr. Azma Putra for their essential supervision, guidance and encouragement towards completing this project. I feel very privileged to join the Sustainable Maintenance Engineering (SusME) research group Centre for Advanced Research on Energy (CARe) FKM UTeM. I am thankful to my colleagues in the group especially to those in the field of energy harvesting for their support and knowledge sharing.

I would like to thank for all co-operation given by all the technicians directly or indirectly during the experimental work of this project, specifically to Mr. Johardi bin Abdul Jabarof SusME laboratory for providing all the needs during experiment and rapid prototyping laboratory for producing the device.

I would also like to acknowledge the financial support from the Ministry of Higher Education Malaysia and Universiti Teknikal Malaysia Melaka for the grant awarded (FRGS/2010/FKM/TK03/12/F0010) for this project.

Most importantly, I would like to thank my parents for their supports and prayers.

4.6 Force against displacement graph of measured data curve (red solid line) and curve fitting results (black dashed line).

4.7 Graph of force against displacement for different angle of twist. 180 degree (yellow dashed line), 360 degree (green dotted line), 540 degree (blue dash-dotted line), 720 degree (black solid line with square marker) and 900 degree (red solid line).

4.8 Stiffness-deflection curve for device with different angle of twist. 180 degree (blue dashed line), 360 degree (black dotted line), 540 degree (purple dash-dotted line), 720 degree (green solid line) and 900 degree (red solid line).
4.9 Force against displacement curves for non-linear softening configuration for different gaps. $d_{ls} = 20$ mm (black solid line), $d_{ls} = 15$ mm (blue dotted line), $d_{ls} = 10$ mm (red dashed line).

4.10 Stiffness-deflection curve for device of non-linear softening configuration with different lower magnets gap. $d_{ls} = 20$ mm (black solid line), $d_{ls} = 15$ mm (blue dotted line), $d_{ls} = 10$ mm (red dashed line).

4.11 Graph of force against displacement for non-linear hardening parameter tuning. Configuration 1, $d_{uh} = 30$ mm and $d_{lh} = 25$ mm (black solid line), Configuration 2, $d_{uh} = 23$ mm and $d_{lh} = 23$ mm (blue dotted line), Configuration 3, $d_{uh} = 15$ mm and $d_{lh} = 21$ mm (red dashed line).

4.12 Stiffness-deflection curve for device of non-linear hardening configuration with different lower magnets gap. Configuration 1, $d_{uh} = 30$ mm and $d_{lh} = 25$ mm (black solid line), Configuration 2, $d_{uh} = 23$ mm and $d_{lh} = 23$ mm (blue dotted line), Configuration 3, $d_{uh} = 15$ mm and $d_{lh} = 21$ mm (red dashed line).

4.13 Setup diagram for the dynamic measurement.

4.14 Dynamic test arrangement.

4.15 Time response of mass with single step input. (a) Softening device setup and (b) hardening device setup. The dashed line represents the impulse to excite the device.

4.16 Frequency response curve for device with (a) 180 degree, (b) 360 degree, (c) 540 degree, (d) 720 degree and (e) 900 degree. Sweep-up (solid line) and sweep-down (dashed line).

4.17 Frequency response curve with different lower magnet separation distance, $d_{ls}$. (a) $d_{ls} = 25$ mm, (b) $d_{ls} = 15$ mm and (c) $d_{ls} = 10$ mm. Sweep-up (solid line) and sweep-down (dashed line).

4.18 Frequency response curve of device with hardening configuration. Parameters setting of $d_{uh} = 30$ mm and $d_{lh} = 25$ mm (a), $d_{uh} = 23$ mm and $d_{lh} = 23$ mm (b), $d_{uh} = 15$ mm and $d_{lh} = 21$ mm (c). Sweep-up frequency (solid line) and sweep-down frequency (dashed line).

4.19 Frequency response curves for device with integrated configuration of hardening non-linear and softening non-linear. (a) Device with Configuration 1 setting, (b) Configuration 2 Setting and (c)
Configuration 3 setting. Sweep-up frequency (solid line) and sweep-down frequency (dashed line).

4.20 Output results for device with spring tuning variables. Input motion from head (green dash dot line), wrist (blue dotted line), waist (red dashed line) and leg (black solid line). Input from (a) walking with 5 km/h speed and (b) jogging with 9 km/h.

4.21 Output results for device with combined configuration. Input motion from head (dash dot line), wrist (dotted line), waist (dashed line) and leg (solid line). (a) Input control of walking at 5 km/h speed and (b) jogging at 9 km/h.

CHAPTER 1

INTRODUCTION

1.1 Energy Harvesting

A megawatt power plant produces sufficient electricity to empower house appliances. In house, some appliances or devices use direct plug in socket to operate, however, for the device that uses battery as power source, the socket is merely used to recharge the battery. These kinds of devices can be categorized as wireless or wearable gadgets. In recent years, it has been proven that these kind of gadgets power usage is going towards a smaller scale for its operation, thus it creates an opportunity to create a device that has the ability to harvest energy from ambient sources that can power themselves. The positive side of this is that it can overcome the lack of efficiency that a battery cannot offer but the major task is how to manipulate various sources. Figure 1.1 shows mobile computing improvement and battery energy density over the past few years. The figure indicates that the computing technology improvement increases but the energy density of a battery remain stagnant over the past year.
Improvement in the gadget operation means that less power is needed for its operation, which is why most of the gadgets these days are getting smaller. One of the factors is because of the battery size is getting smaller but yet still able to operate the gadgets. Figure 1.2 demonstrates that less power supply is needed due to lower time taken for computation as the technology evolves over the past years.

Energy harvesting occurs when the available ambient sources are converted into useful energy such as electrical energy. Ambient source such as wind flow, thermal
