## DECLARATION

I declare that this thesis entitled “Gamification to Improve Student Engagements in Software Engineering Class: A Case Study in UTeM” is the result of my own research except as cited in the references. The thesis has not been accepted for any degree and is not concurrently submitted in candidature of any other degree.

Signature : .....

Name : Nur Faiqah Binti Ab Hamid @ Fauzi

Date : .....

## **APPROVAL**

I hereby declare that I have read this thesis and in my opinion this thesis is sufficient in term of scope and quality for the award of the degree of Master of Computer Science (Software Engineering and Intelligence).

Signature : .....

Supervisor Name : Mashanum Osman .

Date : .....

## **DEDICATION**

My dedication goes to my beloved parents Ab Hamid @ Fauzi bin Ismail and Ramlah Binti Mohd Nor. They give continuous support to complete my master project. I really thank to them and dedicate this project to them as symbol of my love to them. Furthermore, a special thanks to my supervisor Mashanum Osman, and not to forget my loved friends and my entire class mate for supporting me direct and indirect to finish my project successfully. Thank you so much.

## **ABSTRACT**

Software engineering Software engineering subject is a very important to every computer science student as it will give an overview about the principles, techniques and process required for development and construction of computer systems now and then. Nowadays the common traditional teaching and learning in software engineering subjects is quite dull and monotonous subject due to the basic studies about software engineering is mostly on the theoretical part. These drawbacks of the traditional approach affect the software engineering student engagements elements such as in participation, performance and emotional. Since they are not interesting and attractive, it is difficult to attract the students to focus on the learning process. In order to improve and enhance student engagement in software engineering class, there is an attractive approach suggested in this research is known as gamification approach. Gamification approach can be applied to invent a more qualified student to the community. The proposed approach can encourage students to learn software engineering more effectively and proactively. In this study, we got feedback from 59 respondents of software engineering subject student from computer science background and the data analysis was done using SPSS software. From the result, it shows that the engagement elements of participation, performance and emotional have significant effects on the adoption of gamification in software engineering class.

## ABSTRAK

*Subject kejuruteraan perisian adalah sangat penting kepada setiap pelajar sains komputer kerana ia akan memberi gambaran keseluruhan tentang prinsip-prinsip, teknik dan proses yang diperlukan untuk pembangunan dan pembinaan sistem komputer pada masa kini dan akan datang. Pada masa kini pengajaran tradisional yang sama dan pembelajaran dalam mata pelajaran kejuruteraan perisian adalah agak membosankan kerana kajian asas mengenai kejuruteraan perisian adalah kebanyakannya pada bahagian teori. Kelemahan pendekatan tradisional memberi kesan kepada pelajar kejuruteraan perisian kepada unsur-unsur seperti dalam penyertaan, prestasi dan emosi. Oleh kerana mereka tidak menarik, ia adalah sukar untuk menarik minat pelajar untuk memberi tumpuan kepada proses pembelajaran. Dalam usaha untuk meningkatkan dan meningkatkan penglibatan pelajar di dalam kelas kejuruteraan perisian, terdapat satu pendekatan menarik yang dicadangkan dalam kajian ini dikenali sebagai pendekatan gamification. Pendekatan gamification boleh digunakan untuk mencipta pelajar yang lebih berkecenderungan kepada masyarakat. Pendekatan yang dicadangkan boleh menggalakkan pelajar untuk belajar subjek kejuruteraan perisian dengan lebih berkesan dan proaktif. Dalam kajian ini, kami mendapat maklum balas daripada 59 orang pelajar kejuruteraan perisian dari latar belakang sains komputer dan analisis data telah dilakukan dengan menggunakan perisian SPSS. Dari keputusan itu, ia menunjukkan bahawa unsur-unsur penglibatan penyertaan, prestasi dan emosi mempunyai kesan yang besar ke atas penggunaan gamification dalam kelas kejuruteraan perisian.*

## **ACKNOWLEDGEMENTS**

All praise and thanks to ALLAH, the lord of the Alamin. I would like to express my deep appreciation and sincere gratitude to Mashanum Osman, my supervisor, for her patience, wisdom, invaluable guidance, advice and motivational thoughts from the beginning to the end of this project. Mashanum Osman has been an excellent mentor and has provided unfailing support throughout my research of the GAMIFICATION TO IMPROVE STUDENT ENGAGEMENTS IN SOFTWARE ENGINEERING CLASS: A CASE STUDY IN UTeM.

I am thankful to my beloved parent Ab Hamid @ Fauzi Bin Ismail and Ramlah Binti Mohd Nor who taught me the value of education, and also many thanks to my siblings without your love, doa and endless support, I am sure that I would not have been able to achieve so much. Special thanks to the UTeM lecturers that teach me skills that helps me to reach at this level.

My gratitude also goes to lecturers, friends, and to all might have involved directly or indirectly in doing this research and in giving me some ideas, information and also for spending their valuable time and effort.

# CHAPTER 1

## INTRODUCTION

### 1.1 Introduction

Student engagement in software engineering subject in class is very important to make sure an effective teaching and learning process in education field. A successful teaching and learning will produce a proactive, creative and innovative student in the future. In term of software engineering education, the successfulness of teaching and learning will produce many proactive, creative and innovative fresh graduates and to be software engineer who worth working in the world wide industry market in the software engineering field.

Since there are some problem and issues in the industry have been wrote regarding the software engineering fresh graduates namely have poor communication skills, leadership style, ego, gender issue, poor documentation skills, misinterpretation of requirements, incorrect requirements and etc. (Hayat et al., 2010; Kumari & Pillai, 2013)

These issues will not be an issue and will no longer become a mess to the educators in the educational field if we can consider applying and adopting a new approach which is more engaging and entertaining in the learning and teaching in the software engineering field.

The approach that we are proposing is the Gamification approach. Gamification refers to service design aimed at providing game-like experiences to users, commonly with the end-goal of affecting user behaviour by providing gameful experiences (Huotari and

Hamari, 2012). Persuasive technologies, on the other hand, refer to interactive computer systems designed to change the attitude and/or behaviour of the user (Fogg, 2003).

Gamification methods have been applied in various environments and for different purposes such as enterprise work-places, education, pervasive health care, e-commerce, human resource management and many more. Although these studies indicate that gamification can lead to increased user activity, a detailed analysis of users

The perception of gamification principles has hardly been studied. We are all individuals and are driven by different input factors such as our personality, as well as social or cultural differences. Especially in an education scenario, it is of uttermost importance to measure challenges and risks that occur due to these differences before introducing gamification methods though. On the one hand, we expect gamification to increase student participation.

Why do we want to apply gamifications. As an emerging industry, the game industry develops rapidly in recent years, directly promoted the current popular online games. While the network game brings people entertainment, it also brings about many negative effects at the same time. Some students are addicted to online games, not interested in learning, studies abandoned. In fact, "Playing" is the person's nature, many students have dreams: they can play games, but also can learn professional knowledge well.

In this situation, many educators have done a lot of interactive teaching reform, and actively exploring the teaching mode of gaming and studying. Teaching-and-gaming is an effective teaching method to enhance the interaction between teachers and students. Students like vivid and interesting game teaching form. The teaching activities mode - playing in study, learning in games - may create a relaxed and rich learning scene, helps

students to understand, master the related knowledge. The mode also makes the teaching a new life

In this project, we examine the student engagement in learning software engineering subject using gamification approach versus the traditional approach that have been applied in the software engineering education nowadays. More specifically, we aim to answer the following research questions:

1. What is the current existing problem of student engagement in software engineering subjects?
2. How gamification approaches improves the student engagement especially in participation in software engineering class?
3. Is there any significant different between gamification and face-to-face approach in improving the student engagement in software engineering class?
4. Which element of the student engagement has more significant for student engagements in SE.

Since gamification can be defined as the concept of introducing gaming elements to non-gaming activities. Games are well known as entertaining and attracting activities which engaged people to look forward to it (Deterding et al., 2011).

Gamification approach can give software engineering subject more cheerful and colourful for student to be attracted and study. Student engagement is classified into four elements that are skills, participation, performance and emotional (Dixson, nd). The definition of engagement factors that affected student concentration software engineering class can be referred to the Table 2.1 below.

Figure 1.1: Elements of Engagements

They found four elements illustrating how students devote time and energy in the classroom:

1. skills engagement (keeping up with readings, putting forth effort);
2. emotional engagement (making the course interesting, applying it to their own lives);
3. participation/interaction engagement (having fun, participating actively in small group discussions); and
4. performance engagement (doing well on tests, getting a good grade)

Table 1.1 Definitions of Engagement Factors That Affected Student Concentration  
Software Engineering Class

<b>Skills</b>	<b>Emotional</b>	<b>Participation</b>	<b>Performance</b>
<ul style="list-style-type: none"> <li>• Study regularly.</li> <li>• Stay up on reading.</li> <li>• Look over class notes.</li> <li>• Be organized.</li> <li>• Listen/read carefully.</li> </ul>	<ul style="list-style-type: none"> <li>• Put forth effort.</li> <li>• Find ways to make materials relevant.</li> <li>• Apply to my life</li> <li>• Find ways to make material interesting.</li> <li>• Really desire to learn.</li> </ul>	<ul style="list-style-type: none"> <li>• Have fun, engage and participate actively in all activities.</li> <li>• Help fellow students.</li> <li>• Get to know other students.</li> </ul>	<ul style="list-style-type: none"> <li>• Do well on tests.</li> <li>• Get good grades</li> </ul>

## 1.2 Background of the Study

Software engineering subject is the crucial subject for all software engineering students in most universities in Malaysia. The subject provides an overview of software engineering as a discipline; the subject introduces students to the fundamental principles and methodologies of software engineering. It covers basic knowledge about software development process, software requirements, software design, software testing software quality management and etc. It provides minimum prerequisite knowledge for more detailed and specialized study of software engineering. Students gain experience, via a team project, about life-cycle development of software systems.

Upon completion of this software engineering subject, students should be able to: identify and discuss the technical and engineering activities of producing a software product, describe issues, principles, methods and technology associated with software engineering theory and practices (e.g., planning, requirements engineering, design, coding, testing, quality assurance, and configuration management).

The software engineering subject will include the following topics: introduction to software engineering, models of the software development process, project planning and organization, software requirements and specifications, software design techniques, software quality assurance, software testing, software tools and environments, team project activities and software project management

Software engineering subjects is the subject teaches in the second year students. It suppose to be a warm, entertaining, educating introductory in teaching and learning process to all software engineering students and educators. Usually in a university, a semester got 14 weeks of study weeks before the exam weeks, for a subject such as software engineering subject they provide 2 hours per week for lectures and 2 hours per weeks for lab sessions. So student have to take that 4 hours per weeks to learnt and

understand the subject deeply. For the lecture session usually lectures will give lectures on the topic that I have describe above while in the lab session they will implement them in many ways on study.

When student are more engaging into the technology world, they loves entertainments more than the monotonous, facts and their psychological motivation, behavior and the way of thinking is the things that educators need to take into concern especially in the contact of educations disciplines. Teaching excellent and meets students satisfactions.

So this gamification approach is proposed to increase student interest and level of engagement in this subject. This new approach will help the student in understanding the subject deeply and improve their awareness of how important software engineering subject to their studies and their future. Thus, this also can reduce the huge gap between software industry organization field and education field later as we can produce more qualified fresh graduates to the industry

### **1.3 Problem Statement**

Software engineering subject is a very important to every computer science student as it will give an overview about the principles, techniques and process required for development and construction of computer systems now and then.

Nowadays the common traditional teaching and learning in software engineering subjects is quite dull and monotonous subject due to the basic studies about software engineering is mostly on the theoretical part. It covers basic knowledge about software development process, software requirements, software design, software testing software quality management and etc.

These drawbacks of the traditional approach affect the software engineering student engagements elements such as in participation, performance and emotional. Since they are not interesting and attractive, it is difficult to attract the students to focus on the learning process.

In order to improve and enhance student engagement in software engineering class, there is an attractive approach suggested in this research. We recommended this gamification approach to invent a more qualified student to the community. The proposed approach can encourage students to learn software engineering more effectively and proactively.

#### **1.4 Research Question**

Based on the problem statements as stated in an earlier section, the research question of this study are as follows:

1. What is the current existing problem of student engagement in software engineering subjects?
2. Does gamification approaches improves the student engagement especially in participation in software engineering class?
3. Is there any significant different between gamification and face-to-face approach in improving the student engagement in software engineering class?
4. Which element of the student engagement has more significant for student engagements in SE.
