2019

DECLARATION

I declare that this thesis entitled “Development of the Readability Index Model for Young Adults with Reading Difficulties in Malay Language” is the result of my own research except as cited in the references. The thesis has not been accepted for any degree and is not concurrently submitted in candidature of any other degree.

Supervisor Name	:
Date	:

DEDICATION

This thesis is dedicated to my parents, wife, family and my siblings.
For their love, support, help and encouragement.

ABSTRACT

Recent studies reported different perspectives of the relationship among human, technology and education. Reading is a fundamental part of language competency. The motivation of this study is based on the fact that there are some young adults aged 18 years old and above who still cannot read properly and are having difficulties in reading and writing. Due to the unavailability of a tool that can measure the readability levels of Malay texts, this study proposed an online readability test tool in the Malay language to include readers who have reading difficulties by using an existing conventional calculation method developed by the Malay linguists. This formula was then transformed into a computing algorithm to detect the difficult words in Malay texts. This online tool is known as *Sistem Penilaian Kebolehbacaan Bahasa Melayu* (SPIKE) aims to measure the readability levels of Malay reading materials and to focus on detecting difficult Malay words. SPICE (Software Process Improvement and Capability Determination) had been chosen as research methodology, where consists of five main ideas which are S(Situation), P(Problem), I(Investigate), C (Construct) and E(Evaluate). SPIKE is part of a continuous work done to evaluate the reading competencies among young adults with dyslexia. From the existing readability formula and recent studies, a new parameter, which is the potential difficult word was found to help the dyslexics, especially in reading. The findings reported that the additional parameters like words that have more than three syllables and potential difficult words influenced the time taken in reading the assessment. This tool will increase the accuracies in measuring reading competencies among young adults, and will be able to help the dyslexic users with reading difficulties in knowing the level of readability of each reading materials.

ABSTRAK

Akhir-akhir ini banyak kajian telah membuktikan bahawa terdapat banyak pandangan perspektif dari segi hubungan antara manusia, teknologi dan pendidikan. Seperti yang kita tahu, membaca adalah sebahagian asas kompetensi bahasa. Motivasi untuk mengkaji masalah ini disebabkan sebilangan orang dewasa berumur 18 tahun ke atas masih tidak boleh membaca dan menulis dengan lancar. Disebabkan tiada alat yang boleh mengukur tahap kebolehbacaan teks Melayu, ahli bahasa Melayu sebelum ini menggunakan kaedah pengiraan kebolehbacaan secara konvensional. Kajian ini telah mencadangkan satu alat dalam talian di dalam Bahasa Melayu untuk membantu pembaca yang mempunyai masalah membaca dan kemudiannya diubah menjadi algoritma pengkomputeran untuk mengesan perkataan sukar dalam teks Melayu. Alat dalam talian ini dikenali sebagai Sistem Penilaian Kebolehbacaan Bahasa Melayu (SPIKE), di mana bertujuan untuk mengukur tahap kebolehbacaan bahan bacaan bahasa Melayu dan memberi tumpuan kepada mengesan perkataan sukar Bahasa Melayu. SPIKE (Software Process Improvement and Capability Determination) telah dipilih sebagai kaedah penyelidikan di mana mempunyai lima idea utama iaitu S(Situation), P(Problem), I(Investigate), C (Construct) and E(Evaluate). SPIKE adalah sebahagian daripada kajian yang dilakukan untuk menguji kecekapan pembacaan dalam kalangan orang dewasa yang menghadapi disleksia. Berdasarkan formula sedia ada dan kajian terdahulu, kami memperkenalkan parameter baru, di mana parameter tersebut dikenali sebagai perkataan yang berpotensi sukar dan boleh membantu orang disleksia ketika membaca. Keputusan menunjukkan parameter baru seperti perkataan yang mempunyai lebih daripada tiga suku kata dan perkataan yang berpotensi sukar memberi kesan kepada masa ketika orang dewasa membaca. Alat ini dapat membantu meningkatkan ketepatan dalam mengukur kompetensi bacaan bagi orang dewasa dan membantu pengguna disleksia yang mempunyai masalah dalam bacaan dengan mengetahui tahap kebolehbacaan setiap bahan bacaan.

ACKNOWLEDGEMENTS

First and foremost, I would like to thank Allah for giving me the strength to finish my study. I would like to acknowledge my limitless gratitude to both of my supervisors, Dr. Mohd Hafiz Bin Zakaria and Mrs. Syariffanor Binti Hisham for their supports, expertise, generously shared knowledge, insightful criticism, and guidance throughout my research or writing. Thank you again for their time spent on me. I am deeply indebted to my beloved parent, Mohamad Hazawawi Bin Yusof and Arpah Binti Atan, for their untiring love, motivation, moral support and also financial assistance in order for me to finish my study. To my sisters, Nur Amanina Binti Mohamad Hazawawi and Nur Amalia Binti Mohamad Hazawawi, thank you for the encouragement and support. To my husband, Ahmed Yaser Bin Mohd Zabawi, thank you for your assistance and words of encouragement. It was a great help throughout the course of this research work. I humbly extend my thanks to all who have given full cooperation throughout the journey in completing my study.

CHAPTER 1

INTRODUCTION

Readability formula, a mathematical formula, was proposed since long ago to measure reading ease and grade level. Readability formulas were constructed from two basic parameters which were average words per sentence and average syllables per words (Doverspike, 2015). The Malay language readability test tool, named *Sistem Penilaian Kebolehbacaan Bahasa Melayu* (SPIKE) was developed to assist readers in knowing the score of a Malay text and acquired reading level and grade level. Readability formula in Malay language was proposed by Khadijah Rohani in 1984 and was implemented in the SPIKE. The existing readability test tools were made primarily for English text with options of either to type or to paste the text, link directly from the webpage, and the scored will be calculated based on several readability formula like Flesch Kincaid Grade Level and SMOG Index and so on. For this reason, this project was carried out to propose an expansion of readability formula that can measure reading ease in Malay language and indirectly could assist people with reading difficulties. Furthermore, readability has focused more on the reader factors which may affect understanding (Wray and Janan, 2013). The motivation of this study is based on the fact that there are some young adults aged 18 years old and above who still cannot read properly and are having difficulties in reading and writing. At the meantime, most people are not aware of the suitable reading materials that would match their reading competencies and their age level. SPIKE was introduced to cater this problem, where Information and Communication Technology (ICT) solution was used to measure level of

reading by developing an online readability test tool. The new technologies were integrated with existing technologies in use, where calculation was transformed from manual calculation into automated calculation through online test tool. In order to implement this new technology, someone has to be skillful enough to manage the challenges that go along with implementing the changes. It was observed that new and emerging technologies were being integrated with the older technologies to make ICT applications in education more effective. Overall, technology change can improve efficiency, increase quality and also enhance communication (Delaney and D'Agostino, 2015). In the last two decades, technology investment in schools show an increment, based on the assumption that technology-mediated learning environments offered chances for undergraduates to analyze information, solve problems, communicate and collaborate with each other (Lim et. al., 2013). In addition, one of the reasons that ICT literacy was included was not only technological proficiency, but also cognitive skills such as those underlying reading and problem solving, which are critical to using ICT literacy effectively (International ICT Literacy Panel, 2002). ICT literacy involve the form of literacy, where communicating data thru digital medium were as critical as reading and writing were in prior hundreds of years. ICT proficiency model encompassed 7 components which were define, access, manage, integrate, evaluate, create, and communicate, where those were within the context of cognitive, ethical and technical (Gregorian, 2002; Kartz and Macklin, 2007). The first part of this chapter started with the background information regarding potentially dyslexics among Malaysian young adults. The definition of dyslexia and the age range for young adults in Malaysia and other countries were explained in the same section. Other than that, existing readability formulas in English as well as the advantages and benefits of having this readability formula in Malay language were discussed briefly in this chapter. Furthermore, research questions and research objectives were portrayed based on our

research motivations in section 1.4 and 1.5 respectively. The research contributions were mentioned prior to this study. The last section of this chapter showed the outline of the whole thesis.

1.1 Background of the study

Identifying potential dyslexics among young adults could be a difficult task. This was due to lack of awareness about the impacts of dyslexia to young adults, and partly because of the current dyslexia awareness related activities in Malaysia that were mainly focused on the intervention program for children with dyslexia.

1.1.1 Young adults with dyslexia

Based on a report by British Dyslexia Association and Dyslexia International, in higher education, young adults complained of poor support within their sectors; their lecturers and tutors had lack of awareness regarding dyslexia. For example, the exam format can be biased to dyslexic students (British Dyslexia Association, 2012; Dyslexia International, 2016). Some of the dyslexic students maybe had overcome their reading problems but they certainly do not become a skilled reader.

Below showed a graph of statistics by *Program Pendidikan Khas* in Malaysia on students with dyslexia in primary and secondary schools from 2013 till 2017.

Figure 1.1 below showed that there were a dramatically increase in the number of students with dyslexia who enrolled in the education program from 2013 until 2017.

Figure 1.1: Statistic of students with Dyslexia in *Program Pendidikan Khas* in Malaysia
(Data pendidikan khas, pendidikan khas, Kementerian Pendidikan Malaysia)

Young adults with dyslexia in Malaysia faced more challenges due to the fact that they had to master more than one language. Textual information was difficult to understand by young adults with dyslexia even some of them might have survived secondary and tertiary education (Rose, 2009). There was a crucial need to have research evidences on the prevalence of dyslexia among young adults in Malaysia. Online dyslexia screening was thought as potential instrument to identify students with dyslexia at schools (Ekhsan, Ahmad, Halim, etc, 2012). This was partly due to the fact that many young adults were not screened during their childhood. This was supported by a study that reported that many teachers had to go through the tough experience in teaching slow readers (Turner, 1997). It was observed that screening for young adults usually require a higher scale of guidance (Singleton, 2009). In Malaysia, there are still no online dyslexia screening, hence the community had to visit dyslexia centers to run-through the manual screening test which was done by the experts, and that could be timely and expensive. Yet, Turner (1997) argued that there could be some difficulties to screen for dyslexia in conditions that are hard to put it in right way and do not much impairment.
