## DECLARATION

I declare that this thesis entitle "Gait Force-Based Multimodal Fusion Architectures With Deep Neural Networks for Gait Disorders in Older Adults, " is the result of my own research except as cited in the references. The thesis has not been accepted for any degree and is not concurrently submitted in candidature of any other degree.

Student Name : **RAHMAN KAZI ASHIKUR**

UNIVERSITI TEKNIKAL MALAYSIA MELAKA

Date : 27/05/2025

## APPROVAL

I hereby declare that I have read this thesis, and in my opinion, this thesis is sufficient in terms of scope and quality for the award of Master of Science in Electrical Engineering.

## DEDICATION

To my family, my master's supervisor, and my friends for their invaluable support and generous prayers.

## ABSTRACT

Gait analysis is an important way to help diagnose neurodegenerative diseases early, especially in older adults. Small changes in the way people walk can show the start of diseases like Parkinson's Disease (PD), Huntington's Disease (HD), and Amyotrophic Lateral Sclerosis (ALS). This study looks at the time and frequency patterns of gait signals using Continuous Wavelet Transform (CWT). This method helps better understand the vertical Ground Reaction Force (vGRF) signals and find small problems in walking. Even though this is useful, it is still hard to tell these diseases apart because their walking features can be similar, and aging also changes how people walk. The study used data from 64 people: 13 with ALS, 15 with PD, 20 with HD, and 16 healthy controls. Since the focus is on older adults, only data from those aged 50 and above were used. The main goal was to build a strong model that uses time-frequency features from vGRF signals along with clinical information to improve early detection and work well for different people. The work was done in three steps. First, common machine learning methods, Support Vector Machine (SVM), Random Forest (RF), Decision Tree (DT), and Multilayer Perceptron (MLP) were trained using handpicked features from the vGRF data. SVM gave the best accuracy of 83.3%. These methods worked well but depended on features chosen by hand, which limits how well work on new data. Next, deep learning methods were used by changing the vGRF signals into time-frequency images using CWT. Convolutional Neural Networks (CNN) and ResNet-50 models learned features automatically from these images. They reached accuracy rates of 95.18% and 95.06%, respectively. But these models only used signal data and did not include clinical details like age, gender, and disease severity, which can affect walking. Finally, a combined deep learning model was made that used both the spectrogram images and clinical data together. This model could learn walking patterns and personal differences at the same time. It had the highest accuracy of 98.46%, with good sensitivity, specificity, precision, and F1-score. This shows it can reliably tell apart different neurodegenerative gait disorders.

**SENI BINA PENGGABUNGAN MULTIMODAL BERASASKAN KEKUATAN GAIT  
DENGAN RANGKAIAN NEURAL DALAM UNTUK GANGGUAN GAIT DALAM  
KALANGAN WARGA EMAS**

**ABSTRAK**

*Analisis gaya berjalan adalah cara penting untuk membantu mendiagnosis penyakit neurodegeneratif lebih awal, terutamanya pada orang dewasa yang lebih tua. Perubahan kecil dalam cara orang berjalan boleh menunjukkan permulaan penyakit seperti Penyakit Parkinson (PD), Penyakit Huntington (HD), dan Amyotrophic Lateral Sclerosis (ALS). Kajian ini melihat corak masa dan kekerapan isyarat gaya berjalan menggunakan Continuous Wavelet Transform (CWT). Kaedah ini membantu lebih memahami isyarat Ground Reaction Force (vGRF) menegak dan mencari masalah kecil dalam berjalan. Walaupun ini berguna, masih sukar untuk membezakan penyakit ini kerana ciri berjalan mereka mungkin serupa, dan penuaan juga mengubah cara orang berjalan. Kajian itu menggunakan data daripada 64 orang: 13 dengan ALS, 15 dengan PD, 20 dengan HD, dan 16 kawalan sihat. Memandangkan tumpuan diberikan kepada orang dewasa yang lebih tua, hanya data daripada mereka yang berumur 50 tahun ke atas digunakan. Matlamat utama adalah untuk membina model kukuh yang menggunakan ciri kekerapan masa daripada isyarat vGRF bersama-sama dengan maklumat klinikal untuk meningkatkan pengesanan awal dan berfungsi dengan baik untuk orang yang berbeza. Kerja itu dilakukan dalam tiga langkah. Pertama, kaedah pembelajaran mesin biasa, Mesin Vektor Sokongan (SVM), Hutan Rawak (RF), Pokok Keputusan (DT) dan Multilayer Perceptron (MLP) telah dilatih menggunakan ciri pilihan daripada data vGRF. SVM memberikan ketepatan terbaik sebanyak 83.3%. Kaedah ini berfungsi dengan baik tetapi bergantung pada ciri yang dipilih secara manual, yang mengehadkan keberkesanan data baharu. Seterusnya, kaedah pembelajaran mendalam digunakan dengan menukar isyarat vGRF kepada imej frekuensi masa menggunakan CWT. Model Rangkaian Neural Convolutional (CNN) dan ResNet-50 mempelajari ciri secara automatik daripada imej ini. Mereka mencapai kadar ketepatan 95.18% dan 95.06%, masing-masing. Tetapi model ini hanya menggunakan data isyarat dan tidak menyertakan butiran klinikal seperti umur, jantina dan keterukan penyakit, yang boleh menjejaskan berjalan. Akhirnya, model pembelajaran mendalam gabungan telah dibuat yang menggunakan kedua-dua imej spektrogram dan data klinikal bersama-sama. Model ini boleh mempelajari corak berjalan dan perbezaan peribadi pada masa yang sama. Ia mempunyai ketepatan tertinggi 98.46%, dengan kepekaan, kekhususan, ketepatan dan skor F1 yang baik. Ini menunjukkan ia boleh membezakan dengan pasti gangguan gaya berjalan neurodegeneratif yang berbeza.*

## ACKNOWLEDGEMENTS

In the name of Allah, the Most Gracious and the Most Merciful. First and foremost, I offer my deepest gratitude to Almighty ALLAH for granting me the strength, knowledge, and perseverance to undertake and complete this research. I wish to express my appreciation to Ts. Dr. Ezreen Farina Binti Shair from the Faculty of Electrical Technology and Engineering (FTKE), Universiti Teknikal Malaysia Melaka (UTeM), for her invaluable supervision, support, and encouragement throughout this project. Her expertise and constructive feedback have greatly enriched my work. I extend my sincere thanks to Assoc. Prof. Ir. Ts. Dr. Abdul Rahim bin Abdullah from the same faculty for his insightful guidance and unwavering assistance. I also acknowledge the essential ground-truth data and laboratory facilities provided, which were crucial for the successful execution of this study. I am deeply grateful for the financial support provided by the Fundamental Research Grant Scheme from the Ministry of Higher Education Malaysia grant (FRGS/1/2023/SKK06/UTeM/02/1), as well as the Kesidang scholarship from UTeM. Without this assistance, the progress and completion of this research would have been far more challenging.

My deepest gratitude goes to my beloved family for their endless love, prayers, and moral support. Their unwavering belief in my capabilities has been my greatest motivation. I also appreciate my friends and colleagues who have stood by me, sharing both the triumphs and challenges, and offering words of encouragement whenever needed. Finally, I dedicate this work to everyone who has contributed, directly or indirectly, to making this journey possible. May these collective efforts lead to meaningful advancements in this field and benefit all who are touched by this research.
