Published Date: 16 December 2024

Abstract

This systematic literature analysis explores the fundamental role of training and development (T&D) in enhancing employee performance within the automotive industry's R&D departments. Given the industry's changing market needs and quickening pace of technical change, T&D programs are crucial in ensuring that employees achieve the required performance. Key topics in the evaluation include employee engagement, skill development, technology integration, and thorough organisational and requirement studies to determine the effects of structured T&D programs on workforce performance. Important factors including training quality, a variety of approaches, assessment procedures, budgetary allocation, and scheduling were examined to ascertain how they affect the efficacy of T&D initiatives. This study also investigates how Social Learning Theory serves as a basis for productive employee cooperation and information sharing. Furthermore, as innovation is essential in gaining competitive edge in R&D-intensive industries, the study emphasises how important it is to match training curricula with technology developments. Ultimately, this review offers leaders in the automotive sector insightful information, indicating that well-crafted T&D frameworks not only enhance individual performance and flexibility, but also promote a culture of ongoing learning, innovation, and long-term organisational success in a changing market.

Keywords: Training and Development, Technology, Skill Enhancement, Employee Engagement, Personalities, Training Need Assessment, Training Quality, Training Method, Training Evaluation, Employee Performance

Introduction

Employee performance is a major factor in the success of an organisation, particularly in fast-paced sectors like the automotive industry where fierce competition and technology improvements require highly qualified and flexible staff. Employee training and development

initiatives are crucial in this regard for improving workers' performance (Lee et al., 2020). Effective trainings not only revolve around delivering relevant content but also need to be aligned with organizational goals and able to address the unique requirements of each role (Sitzmann & Weinhardt, 2018). Training Need Assessment (TNA), Training Quality, Training Method, and Training Evaluation are the four essential components of training that organisations must prioritise in order to accomplish effective training. Each of these elements plays a part in how well training initiatives work and how they affect employee productivity.

This systematic review explores the relationship between these training elements and employee performance, incorporating examples and insights from past studies. Specifically, this study examines how TNA helps organizations identify skill gaps, how training quality ensures content relevance and applicability, how training methods influence knowledge retention, and how training evaluation serves as a feedback loop for continuous improvement. Organisations will be able to create training programs that improve staff capabilities and promote organisational development by including these factors.

Training & Development (T&D) in Automotive Industry

Due to strict regulatory requirements, shifting customer preferences, and technological breakthroughs, the automotive industry is experiencing substantial transition (Kamble et al., 2023). Automotive organisations need to make sure that their staff have the skills and knowledge necessary to adapt to these developments to stay competitive (Whysall et al., 2019). T&D programs are essential because they provide employees with the individual skills to adopt to new technology, and support the growth of the business as a whole (Park et al., 2018).

Technology towards Employee Performance

Employees need to be highly proficient in technology due to the integration of sophisticated technologies like autonomous driving, smart manufacturing, and electric cars (EVs) (Stewart & Kelley, 2020). Technology-focused T&D programs aim to provide staff members with up-to-date knowledge of the newest advancements in the automotive industry, instruction in the use of sophisticated diagnostic and repair equipment, and familiarisation with the hardware and software used in the design and manufacture of vehicles (Blayone, 2021). These programs also foster awareness of cybersecurity precautions that are necessary for safeguarding connected automobiles. Employees must be ready for the technological changes in the industry, hence the need for them to be given training on topics like data analysis tools, autonomous car sensors, and electric powertrain systems utilised in predictive maintenance (Jain et al., 2022).

Skill Enhancement towards Employee Performance

Another essential element of T&D in the automotive sector is skill enhancement. Enhancing workers' skills in the automobile business will give them the sophisticated knowledge and skills to manage new technology and procedures (Hannola et al., 2018). This is necessary to satisfy changing industry requirements, preserve competitive advantage, and guarantee high-quality output (Kutnjak et al., 2019). Initiatives aimed at improving skills must focus on soft skills like problem-solving, collaboration, and effective communication, as well as technical abilities like robotics, computer-aided design (CAD), and precision engineering (ElMaraghy et al., 2021). Employees can perform tasks more effectively with sophisticated equipment,

interact across departments, and contribute to productive workplace by honing these talents (Irabor & Okolie, 2019).

Employee Engagement towards Employee Performance

Another important area of attention for T&D programs in the automotive sector is employee engagement. Motivated, effective, and devoted to their company are traits of engaged workers (Young et al., 2018). Initiatives that encourage professional development, fit with workers' career goals, and create a positive work atmosphere are examples of T&D programs that put an emphasis on employee engagement (Fletcher et al., 2018). Generally, these initiatives improve performance and work happiness in addition to retaining outstanding individuals in the organisations. Automobile organisations can produce workforce that is more committed and productive by investing in employee engagement via training and development. In a study conducted by Carter et al. (2018), compared to self-efficacy, employee engagement obtained eight times more hits in business management publications.

Personalities towards Employee Performance

Programs for training and development are influenced by individual personality features (Ali, 2019). By being aware of these characteristics, training methods may be tailored to optimize learning results. Employees who exhibit high levels of openness to experience, for instance could gain more from creative and experimental training approaches while employees that exhibit high levels of conscientiousness would perform best in regimented, meticulous training sessions. To comprehend how various personality characteristics affect learning and development, the Big Five personality traits which are conscientiousness, extraversion, agreeableness, and neuroticism are often used (Zell & Lesick, 2022).

Requirement Analysis

Successful T&D programs begin with thorough requirements analysis (Bibi et al., 2018). It entails methodically cataloguing the unique training requirements of a company, divisions, and workers. This method improves the efficacy and relevance of T&D programs by making sure that they are specifically designed to fill in the real gaps in knowledge and skills.

Training Need Assessment (TNA) towards Employee Performance

A crucial initial step in developing efficient training programs is by first conducting Training Need Assessment (TNA). It identifies the precise knowledge and skill shortages in the workforce, guaranteeing that training materials cover real-world requirements rather than just subjects (Rodzalan et al., 2024). TNA helps businesses to more efficiently allocate resources by coordinating training with organisational goals, increasing the effectiveness and ensuring the relevance of their training initiatives (Amin & Hossain, 2024).

According to a study by Madhumita and Thairiyam (2023), TNA is crucial in the manufacturing industry, where operational effectiveness depends on specialised technical skills. Based on that study, TNA assists companies in matching worker's competencies with job specifications, reducing skill gaps that might otherwise affect output. TNA enables businesses to pinpoint the exact competencies that workers require in the automotive sector, where sophisticated machinery and cutting-edge technologies are essential. An automotive company's TNA, for example, may indicate a deficiency in knowledge regarding electric vehicle (EV) technology,

leading the company to create specialised training courses on battery management and EV maintenance.

TNA is essential for enabling organisations to stay competitive by ensuring the employees to have the skills necessary to adapt to technological shifts, improving overall performance and organisational agility, according to a different study by Hamidi (2020) that examined the role of TNA in adapting to technological advancements in automotive manufacturing. The findings of that study concluded that companies with strong TNA processes were better equipped to train employees in emerging technologies like autonomous driving systems.

Training Quality towards Employee Performance

The effectiveness of training programs is largely determined by the quality of the training (Ford et al., 2018). Employees that participate in high-quality training programs acquire useful and applicable skills because they are taught by qualified instructors in which the trainings include thoroughly researched and pertinent content (Okolie et al., 2020). Better job performance, lower error rates, and greater employee engagement and satisfaction are all correlated with high-quality training (Ali et al., 2018).

Sung and Choi (2018) investigated the connection between employee performance and training quality and discovered that good training improved workers' capacity to remember and use new abilities. Given the high stakes involved in the automobile industry, where mistakes in assembly or manufacturing site may result in expensive recalls or even safety hazards, excellent training is crucial. According to Ornellas and Falkner (2019), training programs that include practical exercises and real-world situations are more successful than those that just rely on theory when preparing staff to face challenges unique to their jobs. Workshops that allowed workers to put their theoretical knowledge into practice reduced diagnostic errors in areas such as vehicle sensor troubleshooting.

Employee confidence and technical competence can be raised by training programs that include current material and simulations of cutting-edge automotive technology, such as autonomous systems and sophisticated diagnostics (Hossain, 2023). Employees tend to be more prepared to manage the quick technical changes that are common in their sector as a consequence, which eventually increase the output and decrease operational risks (Temel & Durst, 2021).

Training Method towards Employee Performance

Employee performance is impacted by the training method selection, which also affects how effectively information is acquired and retained (Gope & Elia, 2018). In the automotive industry, where job roles range from design and engineering to production and quality control, employing a variety of training methods can help address diverse learning needs (Goshime et al., 2019). A number of elements, including job function, employee experience level, and the difficulty of the skills being taught, should be taken into account when choosing training techniques.

Research conducted by Ford et al. (2018) had proven that various training approaches affect worker's performance. It was also discovered that practical training was especially useful for technical positions in the automobile industry (Ford et al., 2018). Experiential learning which

includes workshops, simulations, and on-the-job training allows workers to apply their theoretical knowledge in practical situations, which can boost their confidence and proficiency (Martin, 2019). Simulator-based training had been proven to assist workers on the assembly line to practise difficult assembly techniques on virtual equipment, which reduced error and increased productivity (Harboth & Kumpers, 2022).

Additionally, a study on blended learning strategies that combine online instruction with real-world, hands-on training in the automotive sector was carried out by Chong (2023). This approach has been proven to be very successful in applying skills and retaining information. Workers were able to learn at their own speed before applying what they had learnt by mixing in-person seminars with digital learning materials such as interactive modules and video tutorials (Belt & Lowenthal, 2021). This method worked especially well for jobs like automobile diagnostics and repairs that require both technical expertise and problem-solving skills.

Training Evaluation towards Employee Performance

Given that it evaluates the effectiveness of training initiatives and offers suggestions for improvement, training evaluation is an essential component of employee development. By analysing training results, companies may determine if the goals of the training were achieved and whether staff members have gained the necessary abilities. Kirkpatrick's Four-Level Model is one of many models that may be used to evaluate training (Alsalamah & Callinan, 2022). It evaluates behaviour, learning, response, and outcomes.

Previous research by Almost et al. (2019) had extensively used Kirkpatrick's Four-Level Evaluation Model to evaluate the efficacy of training initiatives. That study measured employee reactions, knowledge acquisition, behavioural changes, and overall safety improvements post-training. The study revealed a significant drop in workplace accidents, suggesting that the training had successfully ingrained important safety procedures. This example demonstrates how training programs' practical effects on worker performance and workplace safety can be measured using structured assessment techniques.

On another note, a study by Chhetri et al. (2018) was conducted on the ROI of technical training for automotive engineers specialized in electric and hybrid cars. The study showed that focused and high-quality training produced significant returns for the company by estimating the financial effect of training on performance and productivity. The calculation of ROI enables the management to measure the financial returns on training expenditures, which highlights the need of ongoing, performance-based training assessment (Vasvoka & Serafini, 2022).

Interconnected Relationship of Training Components

Enhancing employee performance requires a comprehensive framework that combines Training Need Assessment (TNA), Training Quality, Training Method, and Training Evaluation. Organisations may identify real skill shortages and tailor their training programs to match employee and organisational requirements with the help of a well-executed TNA. Engagement and skill retention are supported by excellent training that is delivered by knowledgeable teachers which also include real-world scenarios and practical situations (Korucu, 2021). Diverse and customised training approaches are chosen to accommodate

different learning styles, while in-depth training assessments provide useful information that helps organisations improve programs for continued applicability and efficacy (Mikic et al., 2022).

There were notable advantages to using these four training components in an automobile manufacturing company. Competency-focused training on electric vehicle (EV) technology shortened repair times, and employees who received hybrid training approach that included practical exercises with online instruction demonstrated quicker diagnostic skills. Employees' abilities are in line with changing industry standards and developing technology to the training curriculum's iterative improvements brought about by the ongoing feedback obtained from frequent assessments (Chethana & Noronh, 2023).

Conclusion

Effective training programs are shaped by a variety of factors, including TNA, training quality, training method, and training evaluation. The link between employee performance and training is complex. Training programs that are in line with organizational requirements may significantly boost employee performance in high-stakes sectors like automotive manufacturing, where accuracy, safety, and efficiency are critical. Examples from earlier studies showed how organized and methodical training methods promote lifelong learning and prepare staff to handle the changing demands of their positions. In addition to improving staff capabilities, companies that engage in these fundamental training components gain long-term strategic benefits and put themselves in a position to prosper in a market that is competitive and technologically advanced.

Acknowledgement

A special gratitude is extend to all personnel and individuals who contributed to this research. The author also would like to thank Universiti Teknikal Malaysia Melaka (UTeM) for all the support.
